### Juvenile Epilepsy Test (Lagotto Romagnolo)

Name	Breed	Result
Inello	Lagotto Romagnolo	<b>Normal</b>
Reg. Nr. VDH 10/1420505	Chip 276097202141585 *Microchip verified by veterinarian.	

#### The test results are interpreted as follows:

- Normal: No epilepsy mutation and therefore no predisposition to juvenile epilepsy
- Carrier: Heterozygous for the juvenile epilepsy mutation (carries one copy of the juvenile epilepsy mutation)
- Affected: Homozygous for the juvenile epilepsy mutation (carries two copies of the juvenile epilepsy mutation)

Puppies that have increased risk of developing juvenile epilepsy can be born if both parents are heterozygous. The probability of having affected puppies in that case is approximately 25%. If one parent is heterozygous and the other homozygous (affected) the probability of having affected puppies is 50%. If both parents are homozygous only affected puppies will be born. Puppies homozygous for the mutation become affected and experience seizures of variable extent and severity. Few individual heterozygous carriers have also been reported with seizures. The reason for this is unclear with the following possible explanations under further investigations: the carrier puppy has another mutation in the same gene, or there is another mutation in another gene, or the heterozygosity for the mutation lowers the seizure threshold in some puppies. The breed suffers also from a persisting and progressive juvenile ataxia resulting often to the euthanasia of the affected puppy. In addition, there is an adult-onset epilepsy caused by other genetic factors. If your Lagotto was tested as a carrier but has experienced seizures please contact our customer service ([info@genoscooper.com](mailto:info@genoscooper.com)) for further investigation. We are also looking for more ataxia and adult-onset epilepsy cases from the breed to study the genetics of these disorders.
